RetainIQ

Customer churn and retention intelligence · Demo company: Spotify Premium (India) · 60 sample subscribers

Subscribers	At risk (p ≥ 50%)	Annual revenue at risk	Avg churn risk
60	28 (47%)	₹63,744	48%

Expected value of saves
₹20,244

1 · At-risk segments

Segment	At-risk	Avg risk	Revenue at risk (₹/yr)	Recommended strategy
Disengaged	5	59%	8,580	Re-engagement journey: personalized playlist push, “pick up where you left off” email, 2-week discovery challenge
Price-sensitive	0	–	0	Offer 20% off for 3 months or move to a cheaper Duo/Family plan
Support-frustrated	21	70%	49,428	Priority callback from a senior agent plus a one-month service credit
Payment issues	2	95%	5,736	Retry billing, prompt UPI autopay setup and give a 7-day grace period
Content fatigue	0	–	0	Taste reset: refreshed Discover mix, new-release alerts and a curated podcast pack

2 · Subscribers ranked by value of saving them

Segment All

ID	Plan ₹	Tenure	Risk	Top driver	Segment	Value of saving (₹)
C-1054	299	4m	96%	Payment failures	Payment issues	2,052
C-1009	299	5m	93%	Support tickets	Support-frustrated	1,541
C-1031	299	14m	92%	Support tickets	Support-frustrated	1,536
C-1041	299	33m	79%	Support tickets	Support-frustrated	1,294

C-1027	299	12m	75%	Support tickets	Support-frustrated	1,232
C				Payment		

3 · Why this customer may leave, and what to do

Click a subscriber above.

4 · RetainIQ AI agent

> **Main churn pattern:** Support-frustrated is the largest at-risk group (21 of 28), followed by Disengaged (5).

> **Save first:** C-1054 (Payment issues), C-1009 (Support-frustrated), C-1031 (Support-frustrated).

> **Quick win:** payment-issue customers are cheapest to save (₹15 per action, 60% expected save rate). Fix billing before spending on new acquisition.

Ask: who should we save first? why are customers leaving? Ask

How it works (algorithm)

1) Collect usage, billing, support and plan data → 2) Engineer features (usage trend, inactivity, skip rate, tickets, payment failures, price, tenure) → 3) Score churn probability with gradient boosting / survival model → 4) Explain each score with SHAP-style driver contributions → 5) Segment at-risk users by their top driver (K-means in production) → 6) Pick the best retention action per segment using uplift modeling → 7) Rank by expected value = risk × annual value × save rate − cost. This demo uses a fixed explainable scoring model on
